

Frido Dashboard — Formula Reference

All numbers shown in the dashboard are calculated from BigQuery order line-item rows.
Each row = one SKU line in one order. Multiple rows share the same `OrderId` when an order has multiple items.

Data Layer — How Raw Rows Become Orders

Before any KPI is calculated, rows are collapsed into **orders**:

Field on Order	Source column	How
rev	SellingPrice_Inc_GST	Sum of all line rows for this OrderId
excRev	SellingPrice_Exc_GST	Sum of all line rows for this OrderId
qty	ItemQty	Sum of all line rows for this OrderId
items	—	Count of line rows for this OrderId (= number of distinct SKU lines)
isRTO	is_rto = 1	True if any line row has is_rto = 1
isCIR	is_CIR_return = 1	True if any line row has is_CIR_return = 1
isCancelled	is_cancelled = 1	True if any line row has is_cancelled = 1
date	OrderDate	First 10 chars (YYYY-MM-DD)
deliverDate	Delivered_Date	First 10 chars

Shared / Global Formulas (used everywhere)

Name	Formula
Total Gross Revenue	SUM(order.rev) — includes GST
Total Net Revenue	SUM(order.excRev) — excludes GST
GST Collected	Total Gross Revenue - Total Net Revenue
Total Orders	COUNT(distinct OrderIds)
Total Units	SUM(order.qty)
Blended AOV	Total Gross Revenue ÷ Total Orders
nDays	Count of distinct orderDate days in the selected range
Daily Avg Revenue	Total Gross Revenue ÷ nDays

Display formatting

Range	Format
≥ ₹1 Crore (10M)	₹X.XX Cr

≥ ₹1 Lakh (100K)	₹X.X L
Below	₹X,XX,XXX (Indian locale)

Overview Tab

Hero Card

KPI	Formula
Gross Revenue	SUM(order.rev)
Net Revenue	SUM(order.excRev)
GST	Gross - Net
Days / Channels / Orders	Counts from filtered data
Daily Avg	Gross Revenue ÷ nDays

4-column KPI row

KPI	Formula
Orders / Units	COUNT(orders) / SUM(qty)
Units per Order	SUM(qty) ÷ COUNT(orders)
Blended AOV	SUM(rev) ÷ COUNT(orders)
Best AOV channel	Channel with highest channel.rev ÷ channel.orders
Unique Customers	COUNT(distinct CustomerId)
Repeat Rate	COUNT(customers with ≥2 orders) ÷ COUNT(distinct CustomerId) × 100

7-KPI strip

KPI	Formula
Daily Avg Revenue	Gross Revenue ÷ nDays
D2C Share	Shopify.rev ÷ Total Gross Revenue × 100
Repeat Rate	Same as above
Multi-item Rate	COUNT(orders where items > 1) ÷ Total Orders × 100
Q-commerce AOV	(Blinkit.rev + Instamart.rev + Zepto.rev) ÷ (Blinkit.orders + Instamart.orders + Zepto.orders)
Voucher Penetration	COUNT(orders with voucher_code) ÷ Total Orders × 100
High-ticket ≥₹10K	COUNT(orders where rev ≥ 10,000)

Channel Breakdown

Metric	Formula
Channel Revenue	SUM(order.rev) for that channel
Channel %	Channel.rev ÷ Total Gross Revenue × 100
Bar width	Channel.rev ÷ MAX(channel.rev across all channels) × 100

D2C vs Marketplace Bar

Metric	Formula
D2C %	Shopify.rev ÷ Total Gross Revenue × 100
Marketplace %	100 – D2C%

Channel Scorecard

Column	Formula
Revenue	channel.rev
Orders	channel.orders
AOV	channel.rev ÷ channel.orders

Sales Tab — All Channels

KPI Row 1 (original 5)

KPI	Formula
Gross Revenue	SUM(order.rev)
Net (Exc GST)	SUM(order.excRev)
Orders / Units	COUNT(orders) / SUM(qty)
Blended AOV	SUM(rev) ÷ COUNT(orders)
Daily Avg	Gross Revenue ÷ nDays

KPI Row 2 (5 new KPIs)

KPI	Formula
Gross Margin %	(Gross Revenue – Net Revenue) ÷ Gross Revenue × 100 — this is actually the GST % of revenue, since net margin requires cost data
Revenue per Unit	Gross Revenue ÷ Total Units sold

Revenue at Risk	$\text{SUM}(\text{rev of Shopify RTO orders}) + \text{SUM}(\text{rev of Shopify Cancelled orders})$
Fulfilment Rate	$\text{COUNT}(\text{Delivered}) \div (\text{COUNT}(\text{Delivered}) + \text{COUNT}(\text{RTO}) + \text{COUNT}(\text{Cancelled})) \times 100$
Units per Order	$\text{Total Units} \div \text{Total Orders}$

Category × Channel Heat Matrix

Cell	Formula
Cell value	$\text{SUM}(\text{SellingPrice_Inc_GST})$ for rows matching that category AND Channel
Colour intensity	$\text{Cell value} \div \text{MAX}(\text{all cell values}) \rightarrow \text{classes h0/h1/h2/h3/h4}$

Order Value Distribution (Buckets)

Orders are bucketed by `order.rev` :

Bucket	Condition
<₹500	$\text{rev} < 500$
₹500-1K	$500 \leq \text{rev} < 1,000$
₹1K-2.5K	$1,000 \leq \text{rev} < 2,500$
₹2.5K-5K	$2,500 \leq \text{rev} < 5,000$
₹5K-10K	$5,000 \leq \text{rev} < 10,000$
₹10K-25K	$10,000 \leq \text{rev} < 25,000$
₹25K+	$\text{rev} \geq 25,000$

Category Revenue Table

Column	Formula
Revenue	$\text{SUM}(\text{SellingPrice_Inc_GST})$ for all rows in that category
Exc GST	$\text{SUM}(\text{SellingPrice_Exc_GST})$ for that category
Orders	$\text{COUNT}(\text{distinct OrderId})$ in that category
AOV	$\text{Category Revenue} \div \text{Category Orders}$

State Revenue Table

Column	Formula
Revenue	$\text{SUM}(\text{order.rev})$ for orders in that state

Orders	COUNT(orders) in that state
AOV	State Revenue ÷ State Orders
Cities	COUNT(distinct City) in that state

Sales Tab — Individual Channel (Shopify / Amazon / Blinkit etc.)

KPI Row 1

KPI	Formula
Revenue	SUM(order.rev) for that channel only
Orders	COUNT(orders) for that channel
AOV	Channel Revenue ÷ Channel Orders
Units	SUM(order.qty) for that channel
Daily Avg	Channel Revenue ÷ nDays

KPI Row 2

KPI	Formula
Gross Margin %	(Channel rev - Channel excRev) ÷ Channel rev × 100
Revenue per Unit	Channel rev ÷ Channel qty
Revenue at Risk	Shopify only: SUM(rev of RTO orders) + SUM(rev of Cancelled orders) · "N/A" for other channels
Fulfilment Rate	Delivered ÷ (Delivered + RTO + Cancelled) × 100 using that channel's orders
Units per Order	Channel qty ÷ Channel orders

Order Status Bar

Metric	Formula
Count per status	COUNT(orders where orderStatus = X)
Bar width	Status count ÷ Channel total orders × 100
% label	Status count ÷ Channel total orders × 100

Sales Tab — Quick Commerce (QC)

Aggregates Blinkit + Instamart + Zepto together.

KPI	Formula
-----	---------

QC Revenue	Blinkit.rev + Instamart.rev + Zepto.rev
Orders	Blinkit.orders + Instamart.orders + Zepto.orders
Blended AOV	QC Revenue ÷ QC Orders
Best Platform	Platform with highest rev among the 3
QC Rev Share	QC Revenue ÷ Total Gross Revenue × 100

Sales Tab — Operations

KPI	Formula
Avg Delivery TAT	MEAN((Delivered_Date - OrderDate) in days) · Only orders where both dates exist · Capped at 0-60 days
Orders Tracked	Count of orders with both OrderDate and Delivered_Date
Delayed >7d	COUNT(TAT > 7 days)
Cities Covered	COUNT(distinct City) across all orders

TAT Buckets

Bucket	Condition on TAT (days)
Same day	TAT = 0
1-2 days	1 ≤ TAT ≤ 2
3-5 days	3 ≤ TAT ≤ 5
6-7 days	6 ≤ TAT ≤ 7
8-14 days	8 ≤ TAT ≤ 14
15+ days	TAT ≥ 15

Sales Tab — Customers (CX)

KPI	Formula
Unique Customers	COUNT(distinct CustomerId)
Repeat Rate	COUNT(customers with ≥2 orders) ÷ Unique Customers × 100
2× Buyers	COUNT(customers with exactly or more than 2 orders)
3×+ Buyers	COUNT(customers with ≥3 orders)
Voucher Penetration	COUNT(orders with a voucher_code) ÷ Total Orders × 100

Voucher Classification

Voucher codes are bucketed by keyword match:

Bucket	Rule
No voucher	voucher_code is empty
PREPAID-DISCOUNT	code contains "PREPAID" (case-insensitive)
Loyalty (PLM)	code contains "PLM"
Repeat (FRV)	code contains "FRV"
Other/custom	anything else

Voucher Table

Column	Formula
Orders	COUNT(orders) in that voucher bucket
Revenue	SUM(order.rev) in that bucket
AOV	Bucket Revenue ÷ Bucket Orders

Intelligence Tab

Summary Strip (6 metrics)

Metric	Formula
Gross Revenue	SUM(order.rev)
GST Collected	Gross Revenue - Net Revenue
Repeat Rate	Repeat customers ÷ Unique customers × 100
QC Share	(Blinkit + Instamart + Zepto revenue) ÷ Total Revenue × 100
Voucher Orders	COUNT(orders with voucher) ÷ Total Orders × 100
Trend (½ period)	(Second-half revenue - First-half revenue) ÷ First-half revenue × 100 · Period split at midpoint of unique dates

Intel Card 1 — Customer Retention Crisis

Metric	Formula
Headline %	Repeat customers ÷ Unique customers × 100
1× buyers	Unique customers - Repeat customers
2× buyers	COUNT(customers with ≥2 orders)

3×+ buyers	COUNT(customers with ≥3 orders)
Revenue opportunity	$(0.10 - \text{repeat_rate}) \times \text{Unique customers} \times (\text{Total Revenue} \div \text{Total Orders})$ — estimated lift if repeat rate improves to 10%

Intel Card 2 — Q-Commerce Opportunity

Metric	Formula
QC Revenue	Blinkit.rev + Instamart.rev + Zepto.rev
QC AOV	QC Revenue ÷ QC Orders
AOV multiple	QC AOV ÷ Blended AOV
Platform bars	Each platform's rev ÷ QC total revenue × 100
Gap detection	For top 5 categories: check if that category has SUM(rev) = 0 on each QC channel → flagged as missing

Intel Card 3 — Voucher & Discount Drag

Metric	Formula
Voucher penetration	COUNT(vouchered orders) ÷ Total Orders × 100
Vouchered AOV	SUM(rev of vouchered orders) ÷ COUNT(vouchered orders)
Non-vouchered AOV	SUM(rev of non-vouchered orders) ÷ COUNT(non-vouchered orders)
AOV Drag	Non-vouchered AOV – Vouchered AOV
Bars	Top 5 voucher buckets: bucket.rev ÷ Total Revenue × 100

Intel Card 4 — Revenue Concentration (Pareto)

Metric	Formula
Headline %	Top 1% orders revenue ÷ Total Revenue × 100
Top 1% orders	CEIL(Total Orders × 0.01) orders sorted by rev descending
Top 10% orders	CEIL(Total Orders × 0.10) orders sorted by rev descending
Bottom 50%	Orders from rank CEIL(50%) onward
Bar %	Each group's rev ÷ Total Revenue × 100

Intel Card 5 — Returns & RTO (Shopify Only)

Metric	Formula
RTO Rate	COUNT(Shopify orders where isRTO=true) ÷ COUNT(Shopify orders) × 100
CIR Rate	COUNT(Shopify orders where isCIR=true) ÷ COUNT(Shopify orders) × 100

Cancelled %	$\text{COUNT(Shopify orders where isCancelled=true)} \div \text{COUNT(Shopify orders)} \times 100$
Savings per 1% RTO reduction	$\text{COUNT(Shopify orders)} \times 0.01 \times \text{Blended AOV}$

Intel Card 6 — Basket & Multi-item Intelligence

Metric	Formula
Multi-item rate	$\text{COUNT(orders where items > 1)} \div \text{Total Orders} \times 100$
Multi-item AOV	$\text{SUM(rev of multi-item orders)} \div \text{COUNT(multi-item orders)}$
Single-item AOV	$\text{SUM(rev of single-item orders)} \div \text{COUNT(single-item orders)}$
AOV premium	$(\text{Multi-item AOV} - \text{Single-item AOV}) \div \text{Single-item AOV} \times 100$
Bars	Top 5 states by revenue: $\text{state.rev} \div \text{Total Revenue} \times 100$

Period Trend Signal

Metric	Formula
First-half revenue	$\text{SUM(rev)} \text{ for orders on dates in the first 50\% of unique dates}$
Second-half revenue	$\text{SUM(rev)} \text{ for orders on dates in the last 50\% of unique dates}$
Trend %	$(\text{Second-half} - \text{First-half}) \div \text{First-half} \times 100$

Automated Alerts (Overview Tab)

Alerts fire automatically based on these rules:

Alert	Trigger	Type
Revenue declining	$(\text{Second-half rev} - \text{First-half rev}) \div \text{First-half rev} < -10\%$	Red
Blinkit GST broken	$(\text{Inc_GST} - \text{Exc_GST}) \div \text{Exc_GST} > 50\%$ on Blinkit rows	Red
CRED feed gap	Any day where CRED revenue < 20% of daily mean across the period	Red
CIR returns high	$\text{CIR returns} \div \text{Shopify orders} > 10\%$	Amber
Repeat rate low	$\text{Repeat customers} \div \text{Unique customers} < 10\%$	Amber
Q-commerce AOV high	QC AOV > ₹3,000 — opportunity signal	Green

Filters — How They Affect Numbers

Filters narrow the **raw rows** dataset, then all formulas re-run on the filtered set.

Filter	How applied
Date range	Only rows where OrderDate falls within [start, end] (applied in BigQuery query)

Category	Only rows where <code>Category = selected</code>
State	Only rows where <code>State = selected</code> (case-insensitive)
SKU / ProductId	Only rows where <code>ProductId</code> contains the search term

Filters are applied before `processData()` so every KPI, chart, and table reflects the filtered subset.

Column Reference (BigQuery source table)

Column	Used for
<code>OrderId</code>	Grouping rows into orders
<code>OrderDate</code>	Date filtering, TAT calculation, daily trend
<code>Channel</code>	Channel breakdown, QC grouping
<code>SellingPrice_Inc_GST</code>	All revenue KPIs (gross)
<code>SellingPrice_Exc_GST</code>	Net revenue, margin calculations
<code>ItemQty</code>	Unit counts
<code>Category / SubCategory</code>	Category tables, heat matrix
<code>State / City</code>	Geography tables
<code>CustomerId</code>	Repeat rate, customer frequency
<code>voucher_code</code>	Voucher analysis
<code>Order_Status</code>	Fulfilment rate
<code>Delivered_Date</code>	TAT calculation
<code>Dispatch_Date</code>	Ops tracking
<code>is_rto</code>	RTO flags (1 = yes)
<code>is_CIR_return</code>	Customer-initiated return flag
<code>is_cancelled</code>	Cancellation flag
<code>is_exchange</code>	Exchange flag
<code>GST_Tax_Type_Code</code>	GST type breakdown
<code>ProductId</code>	SKU-level filtering and QC product tables
